
CENTRALIZED RESAR

An update

- Centralized data collection will start as soon as the centralized platform, housed in Milan, will be ready
- In September we will have chosen the software house which will assist us to prepare it.
- All RESAR sites will then be contacted to basically link the local DB to the platform. You'll have to identify **somebody** from your IT department to be **in charge** of the transition to be the contact person for the software house and us.
- The platform will be able to randomize patients and will likely use **REDCAP** or the like, but we will be able to learn it as soon as we will have chosen the one who we will be working with
- The link of the local databases with the centralized one will take some 3 months. We expect by Jan 2021 to be able to start the centralized data collection, which will last at least until STRASS 2 will be closed
